Motivation

Throughout the entirety of our lives, we spend countless hours deciding very simple things, such as what food we should eat. Here at Team Foogle, we want to change the way that works. We are attempting to further optimize how individuals decide to eat. Instead of sitting, staring, and pondering about where to go to grab a bite, we have created a database of restaurants and accompanying queries to help speed up this process. In essence, we strive to save people time and allow them to explore a bit more!

Application

The application of our Foogle database is centered mainly in searching restaurants based on the users' wants in a certain city and state. The user can find the restaurant they desire based off of the price, operational hours, reviews, and ratings, among other requirements. The database also provides the restaurants' contacts in the form of emails and phone numbers so that the user can directly communicate for more detailed information. In addition, the user can rate and review restaurants that they have visited.
